Tigernix Remarks - Response, and clarifications

Department	Tigernix Remarks
Project	The platform is delivered as a single centralised suite - all modules (Project, Operations, Procurement, Finance, HR, NRW, Governance) run on one shared data backbone, so every department operates within the same system with cross-module linking (e.g. project → PR → PO → payment) already working. On integration with existing systems: the Tigernix Integration Hub provides open REST APIs and standard connectors (SCADA/OPC-UA, LHDN MyInvois, finance and GIS systems), and integration scoping is included in the Discovery phase (Month 1). Full mobile/smartphone access is standard.
HR & Admin	All five requested functions are available in the Tigernix suite as configurable features, supporting both HR and Admin processes: 1. Ticketing/helpdesk : staff raise requests, PIC assignment, progress tracking, closure and evaluation feedback are standard workflow features. 2. Asset management already extends to Admin & IT custody (vehicles, laptops, IT assets with issue/return records : demonstrated in the IT asset custody function). 3. Performance Management : KPI submission/approval, appraisal review and calibration are configured (the 70/30 KPI year-end evaluation shown in the demo). 4. HR letter automation : system-generated letters (transfer, redesignation, etc.) with in-system acceptance/acknowledgement, archived in document management. 5. eLearning/onboarding modules can be enabled for self-learning tracks. On Payroll: payroll is intentionally handled by your existing external system (Vistra+Orisoft) : Tigernix has the integration framework in place so employee master data, attendance/OT and leave balances flow to payroll and results flow back, with both systems staying in sync; we have delivered similar payroll and payment-gateway integrations in production. Data migration, including the 7 years of archives, is covered under the Data Migration workstream with validation sign-off. On email addresses: Tigernix login does not require a corporate email - users can authenticate by employee ID, and notifications can be delivered in-app/mobile, so the additional Microsoft licence cost is not a prerequisite.

Department	Tigernix Remarks
Procurement	All the features requested are already supported within the Tigernix Procurement module : no alternative platform is required: 1. Emergency purchases : a dedicated emergency PR type captures the incident/reason, justification for direct vendor appointment, expedited approval routing and supporting documents. 2. HOD assignment : approved PRs can be assigned by HOD to specific procurement personnel who carry the record through sourcing, PO/DO, invoice receipt and vendor assessment/performance scoring (vendor scoring was shown in the demo). 3. Procurement KPI tracking : PRs handled per officer, PR-to-PO cycle time and ageing dashboards are standard reports, replacing the current manual tracking. As the requester noted, these are baseline capabilities of the suite : they are configuration, not custom development, and carry no additional licence cost. On **MMC Group alignment**: the platform is configuration-driven (LOA tiers, chart of accounts, approval policies and reporting formats are all configurable) and exposes open APIs, so group-level requirements can be adopted without re-platforming; we are happy to review MMC's requirements in a joint session and evidence each requested feature in a focused follow-up demonstration.
NRW	Tigernix is purpose-built for NRW operations - it is one of the few platforms with NRW performance-contract workflows available out of the box: leak incident reporting with client sign-off, BQ job sheets priced automatically from your rate books, contractor panel management and monthly gain-share claims, alongside DMA/zone dashboards. Every item requested : project cost tracking, work order management, custom NRW reporting dashboards, document attachment and asset management integration : is native to the same suite and data model, so they are delivered through configuration to suit NRW project requirements, not new development. Field asset registers, transfers and custodian coding demonstrated are already aligned to your NRW templates. Navigation and data entry will be streamlined for field use (mobile entry, pre-filled forms) as raised. Data migration, structured user training and local vendor support are included in the implementation and annual support scope. We welcome the second NRW-focused demonstration.
Municipal	Thank you for the positive assessment of the platform's open integration channel.

Department	Tigernix Remarks
	1. PR request/status tracking : every requester has live visibility of their PR status (submitted → approved → PO issued → delivered) with automatic notifications at each step. 2. OPEX/CAPEX — budget control distinguishes OPEX and CAPEX lines with budget-gated approvals, commitment tracking and utilisation reporting, and CAPEX purchases flow through to the fixed asset register. On data sharing: access is governed by role-based permissions per entity/site/department, so data is shared on a need-to-know basis, while the open API channel enables controlled integration with other applications and systems.
